SEQUENCE OF 160-374 FROM N.A.

STRAIN=Isolate 50410;

Patki A.H., Dale J.W.;

Submitted (APR-1991) to the EMBL/GenBank/DDBJ databases.

I. SIMILARITY: Balongs to the mycobacterial PRE family.

-! CAUTION: In strain Oshkosh the gene for this protein is interrupted in position 307 by an IS6110 element.
                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- CAUTION: Ref.3 sequence differs from that shown due to frameshifts in positions 294; 337 and 355.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 protein, Complete proteome. 434 AA, 43029 MW; 410673C4BD389DD6 CRC64;

SIMILARITY: Belongs to the TSC-22/Dip/Bun family.
CAUTION: Ref.2 sequence differs from that shown due to erroneous
gene model prediction.
                             oŧ
the second optic lobe relative to the first. Plays a role in determining proper dorsal cell fates leading to the formation the dorsal appendages.

DISEASE: Involved in some cases of acute undifferentiated leukemia (AUL) through a chromosomal translocation t(6;9) (q21;q34.1) that involves NUP214/CAN and SET.

- SUBCINIT. Homodimer. Interacts with DDX19 and NUR98.

- SUBCELLUIAR LOCATION: Nuclear pore complex. Cytoplasmic filaments.

- TISSUE SPECIFICITY: Expressed in thymus, spleen, bone marrow, kidney, brain and testis, but hardly in all other tissues or in whole embryos during development.

- DOMAIN: Contains F-G repeats.

- PTM: Probably glycosylated as it reacts with wheat germ agglutinin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Buijs A., Grosveld G.,
"The translocation (6;9), associated with a specific subtype of acute myeloid leukemia, results in the fusion of two genes, dek and can, and the expression of a chimeric, leukemia-specific dek-can mRNA."; Mol. Cell. Biol. 12:1687-1697(1992).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
